

Honey Bees Are Endangered

You may have heard of the alarming crash in honey bee populations across the country, but that's just the tip of the iceberg. In some regions, more than 40% of invertebrate pollinator species – bees, moths, butterflies and more – are threatened with extinction.

Honey bees have been diminishing at an alarming rate for years. For those who aren't aware of this seriousness, be aware that 1/3 of our food source is pollinated by honey bees.

When native pollinators die off, it can cause entire ecosystems to unravel, destroying the habitats that we all depend on for survival.

Amateur and commercial beekeepers are attempting to enhance and rebuild this important part of our ecosystem.

Pure Honey available in various sizes — large or small quantities.
